VIBEFINANCE · INDIAN RETAIL INVESTOR DEMO

Evidence first.
Your context next.

Five parallel agents turn market signals, document passages and portfolio constraints into a recommendation you can inspect.

Seeded simulation | Synthetic company documents | No API key required

Educational/simulated, not investment advice (SEBI-registered advice required).

THE PROBLEM

Plenty of signals. Too little context.

Scattered evidence

Price charts, news and company disclosures arrive in separate tools. Their disagreements disappear behind a single score.

Generic conclusions

The same market signal means something different for a retiree with an oversized position and a trader with spare capacity.

Opaque confidence

A confident label is not a probability of profit. People need to see the inputs, policies and missing information.

Our demo makes the decision path visible, including when the evidence is insufficient.

HOW IT WORKS

Independent signals.
A shared, auditable contract.

Inputs

Seeded OHLCV
Synthetic corpus
Investor profile

Ticker-filtered retrieval; exact registered sources.

→

Five agents in parallel

- Momentum
- Volume
- Sentiment
- Filings
- Portfolio risk

Typed labels, computed strength, evidence, source references and degradation status.

→

Synthesis

Resolve conflicts
Apply profile limits
Explain the result

FastAPI + Streamlit; SQLite state.

> Numbers are computed in Python. Deterministic explanations keep the standard demo offline. Optional retrieval and live-data integrations must report their actual mode.

THE PRODUCT MOMENT

Same market.
Different responsibilities.

Open **Compare users** on RELIANCE. The market frame and retrieved documents are identical for all profiles.

Meera

Conservative, long horizon. An existing position over the single-stock limit triggers an exposure review.

Concentration overrides optimism.

Arjun

Moderate risk, staged investing. Supportive independent dimensions can justify a measured accumulation label.

Action follows available capacity.

Rohan

Aggressive, with a history of chasing momentum and panic selling. The result includes a specific behavioral nudge.

Signals do not erase behavior.

> These are illustrative seeded personas, not verified real investors. The running dashboard is the authority for current actions after policy changes.

FIVE-MINUTE DEMONSTRATION

Show the reasoning. Then show its limits.

TIME	SHOW	WHAT TO POINT OUT
0:00–0:30	The problem	Fragmented evidence and generic advice.
0:30–1:30	RELIANCE · Arjun	Five agents, trace, explanation and source passage.
1:30–2:30	Compare users	Identical input; different portfolio constraints and actions.
2:30–3:15	TCS	Bullish technicals versus cautionary filing; explain the conflict.
3:15–4:00	ITC + HDFCBANK	Sentiment outage and missing filing; honest degradation.
4:00–4:40	Metrics	Measured latency, evaluation sample and baseline results.
4:40–5:00	Commercial concept	Research tools, auditability and the production prerequisites.

Keep the silent browser recording and real screenshots available as a backup; they are generated by scripts/capture_demo.py.

EVIDENCE, NOT PERFORMANCE CLAIMS

Measure the demo.
Do not sell it as market edge.

Latency

Use the real sequential-versus-parallel benchmark on equal inputs. Thread overhead can exceed gains for tiny deterministic workloads.

Direction evaluation

Read the generated sample size, intervals, baselines and forward returns. Synthetic results do not demonstrate future investment returns.

Confidence

Signal strength, an up-direction probability and confidence in an action are different quantities. Calibration requires a defined outcome.

> Open the running Metrics tab or generated evaluation report for current values. This deck intentionally contains no frozen accuracy number that could become stale after a code change.

Source identity and passage matching provide provenance. Deterministic claim checks cover the supported extraction rules; they are not a general proof of factual truth.

COMMERCIAL CONCEPT

Trust is the product. Research is the service.

Free watchlist

Educational signals, source inspection and basic watchlists to make research accessible.

Acquisition

Personalized tier

Portfolio context, behavior nudges, what-if analysis and saved research history.

Subscription concept

B2B research API

Structured evidence and auditable explanations for fintechs, advisors and wealth platforms.

Usage / licensing concept

> No revenue, customer traction, pricing or regulatory authorization is claimed. Licensed data, privacy controls, authenticated users, independent evaluation and appropriate SEBI compliance precede real-user use.

WHAT THIS DELIVERY MEANS

A reviewable prototype. A clear next step.

Runnable locally

Use **make demo** for the offline application. The container recipe runs the dashboard and its internal API with persistent state.

Reviewable evidence

Inspect tests, the source registry, evaluation report and current progress tracker. A passing test suite does not prove every blueprint requirement.

Remaining limits

Real-market outperformance is unproven. Broad language understanding, licensed feeds, production security and public hosting are separate work.

The current handoff records **what ran**, **what failed** and **what remains unverified**.
